Museum, galleries month kicks off Luzon leg with twin events

DASMARINAS

CITY, Cavite - The museum and galleries month celebration will formally kick off its South Luzon leg with an exhibit and press conference at the Museo De La Salle (MDLS), an on-campus museum of De La Salle University here on Sept. 24, an official said last Sept. 3.

The National Commission for Culture and the Arts (NCCA), through its National Committee on Museums (NCCA-NCOM), has partnered with MDLS for the South Luzon launch of events.

MDLS director Cecille Tutevilas-Gelacame said the exhibit and press launch "are aimed at acknowledging the

Museo De La Salle (MDLS), an on-campus museum of De La Salle University Dasmarinas (DLSU-D) will be the venue of the Luzon leg of Museum and Galleries Month 2010 celebration on Sept. 24. National Commission for Culture and the Arts-National Committee on Museums (NCCA-NCOM) partners with MDLS to bring the two events—an exhibit and a press conference.

Cavite group presents Sangley airport plan to Duterte in Beijing

Cavite officials and their partner Chinese construction corporations finally got to present their plan for a Sangley International airport to President Bu-

delgo Duterte in Beijing, China. Led by Cavite Governor Juanito Victor "Jovito" Remilla Jr., they were among those who paid a courtesy call on Duterte

during his fifth visit to China. The courtesy calls took place last Aug. 30 at the Grand Hyatt Hotel in Beijing. According to a

source privy to the meeting, the Cavite officials, the Chinese Communications Construction Company (CCCC), and a group led by businessman Liu "Juloy"

Vinzo presented their plans for an international airport in Sangley Point, Cavite. The Cavite provincial government is

role of museums and galleries as instruments in creating national consciousness for Filipinos.

Although the museums and galleries are known to house a plethora of historical collections and artifacts which have awakened unity and commitment in the country that are vital to nation-building. "The event will also highlight that museums and galleries have expanded their functions," Gelaciano added.

"Museums and galleries are no longer just centers of historical and cultural consciousness but has become a platform for dialogues

which best concern the general public, including pressing issues on resilience, peace, and security," she said.

An added treat is the MDLS opening of the "Aniwahe: Creating Forms, Mastering Function," an exhibition that pays tribute to traditional Filipino carpenters' craftsmanship and their conscious regard for both function and form.

Aniwahe will be opened at 10 a.m. which will be followed by a press conference at 2 p.m.

Museums and galleries month is observed every month of October by virtue of Presidential Proclamation No. 798 s. 1991 meant

Biophysics: Stretching proteins with magnetic tweezers

At the central mediators of cell function in biological organisms, proteins are involved in the execution of virtually all cellular processes. They provide the internal scaffolding that gives cells their form, and enable cells to dynamically alter their morphology. They transport substrates back and forth across membranes, and they catalyze most

nering with CCCC, a Chinese state-owned enterprise, for the airport project.

Duarte appeared "generally supportive" of the plans, which will have to go through other processes of government approval and permitting, the source added.

Presidential
Spokesman Salvador

in underscore the importance of arousing the national consciousness and pride in our rich culture and nation-

of the chemical reactions that take place in cells. In the course of these tasks, many proteins are subjected to external forces. Indeed, some 'mechanosensitive' proteins effectively measure the strength of the forces acting upon them and are activated when the imposed force exceeds a given threshold, such as Von Willebrand Factor (VWF), which

Panelo said the Sangley Point International Airport was the subject of a meeting among officials of the local government of Cavite, Cavite Holdings, CCCC, and China Airport Construction Group Company Ltd.

The Cavite provincial government has been given "no objec-

tion, themed 'Building the Nation. One Exhibit at a Time' will have a separate kick-off ceremony in Luzon,

This year's celebra-

institutes the formation of blood clots, is an important representative of this class. The mechanical force required to activate proteins like VWF are often so small that their magnitude could not be determined using existing methods. Now, a team of scientists led by LMD physicist Martin Berrut and Professor Jan Lipfert has developed a much

more sensitive procedure. Their 'magnetic tweezers' can quantify forces that are 100 times smaller than the commonly used alternative method currently available. As Lipfert and colleagues report in the journal PNAS, they have employed the technique to observe the unfolding of the VWF protein under the influence of low mechanical forces.

tion" from the DOJ "to immediately implement the project." Remulla said last Sept. 2.

"All technical studies for the project have been completed, and the province is preparing to begin the process for tender to possible joint venture partners," he added.

He said the Cavite

government is preparing a 3-year timetable to complete the 1st phase of the project.

Asked to describe the involvement of the Chinese corporations at the meeting, Remulla said, "They are prospective partners who are fully committed to be part of the joint venture."

He said the Cavite

government is preparing a 3-year timetable to complete the 1st phase of the project.

He said the Cavite

Victorian child hearing-loss databank to go global

A unique Victorian child hearing-loss databank that profiles children with hearing loss will help researchers globally understand why some children adapt and thrive, while others struggle.

The Victorian Childhood Hearing Impairment Longitudinal Databank, which has collected information for eight years, is featured in the latest International Journal of Epidemiology. Its data shows that some children with hearing loss do not well, while others experience greater difficulties," she says.

DEED OF EXTRAJUDICIAL SETTLEMENT OF ESTATE WITH WAIVER AND SPECIAL POWER OF ATTORNEY

NOTICE is hereby given that the estate of the deceased **JOSÉ TORIBIO YAMBAO SR.**, widower, who died intestate January 5, 2011 in Iloilo, Cebu, consisting of a parcel of land and lot located at 384 9, Lot 3, Hulsley Village, Street 10004 4, Iloilo City, Cebu under Tax Declaration No. 06-0006-72271 and 09-0009-11111, containing an area of TWO HUNDRED FORTY FOUR (244) SQUARE METERS, more or less, has been adjudicated and extrajudicially settled by and among his heirs with notice of the above-described properties in favor of **ROSE M. YAMBAO, JR.**, and with Special Power of Attorney, designating and appointing as their true and lawful attorney-in-fact, **DELINDA M. YAMBAO-CRUZO**, to do and to perform any or all of the following acts and things:

- To file and initiate the necessary proceedings in order to file the Partition for issuance of Owner's copy at the Regional Trial Court of Iloilo, Cebu;
- To attend to all the stages of proceedings of the case in order that a new Owner's Duplicate copy will be granted by the Court and for the issuance of a new copy by the Registry of Deeds for the Province of Cebu;
- To sign, execute all documents and to deliver things and documents and other writings of whatever nature or kind as affect the above-mentioned property.

on August 18, 2019 in the City of Iloilo, Cebu before Notary Public Atty. James M. Lavejo and entered in his Notarial Register as Doc. No. 340, Page No. 18, Book No. XXX, Series of 2019.

Electronic glove offers 'humanlike' features for prosthetic hand users

People with hand amputations experience difficult daily life challenges, often leading to lifelong use of a prosthetic hand and services.

An electronic glove, or e-glove, developed by Purdue University researchers can be worn over a prosthetic hand to provide humanlike softness, warmth, appearance and sensory perception, such as the ability to sense pressure, temperature and hydration. The technology is published in the Aug. 30 edition of NPG Asia Materials.

While a conventional prosthetic hand helps restore mobility, the new e-glove advances the technology by offering the realistic human hand-like features in daily activities and life roles, with the potential to improve their mental health and wellbeing by helping them more naturally integrate into social contexts.

The e-glove uses thin, flexible electronic sensors and miniature silicon-based circuit chips on the consumer-daily available nitrile glove. The e-glove is connected to a specially designed wristwatch, allowing for real-time display of sensory data and remote transmission to the user for post-data processing.

Chi-Hwan Lee, assistant professor in Purdue's College of Engineering, in collaboration with other researchers at Purdue, the University of Georgia and the University of Texas, worked on the development of the e-glove technology.

"We developed a novel concept of the soft-packaged, non-instrumented e-glove built on a commercial nitrile glove, allowing it to seamlessly fit on arbitrary hand shapes," Lee said. "The e-glove is configured with a stretchable form

to collect various information such as pressure, temperature, humidity and electrophysiological signals, while simultaneously providing realistic human hand-like softness, appearance and even warmth."

Lee and his team hope that the appearance and capabilities of the e-glove will improve the well-being of prosthetic hand users by allowing them to find more comfortable in social contexts. The glove is available in different skin tone colors, has life-like fingerprints and artificial fingernails.

"The prospective end user could be any prosthetic hand user who have felt uncomfortable wearing current prosthetic hands, especially in many social contexts," Lee said.

"The fabrication process of the e-glove is cost-effective and manufacturable in high volumes.

Obesity pandemic shifting cancer to younger people

A new study looking at incidence of disease data nationwide from 2000 to 2016 found a shift in obesity-associated cancers (OACs) to younger individuals. Typically, these cancers are diagnosed at high

er rates among people older than 65. The most notable findings pertain to increases in these OACs among non-Hispanic Black and Hispanic women and men for whom certain cancers increased

by 200-400%.

The study, "Changes in Age Distribution of Obesity Associated Cancers," was recently published in JAMA Network Open. It was conducted by a team at Case Western Reserve University School of Medicine and the Case Comprehensive Cancer Center. The team includes Siyan Kotsoskian, Weiduan Dong, and Nathan Berger. Kotsoskian and Berger are faculty with the School of Medicine and members

of the Case Comprehensive Cancer Center. Berger is also an oncologist at Seidman Cancer Center at University Hospitals Cleveland Medical Center.

Data were used from more than six million incident cancer cases from the Surveillance Epidemiology and End Results (SEER) database, recognized as an authoritative source for U.S. cancer statistics. The SEER is administered by National Institute of Health's National

Cancer Institute... of age with cancers di-

"We were struck by agnosed in the years the shift in obesity-associated cancers to people in the 20 to 49 age group, but most notably those in the 50 to 64 age range," said Kotsoskian. "Keep in mind that the population aged 50 to 64 increased in number by nearly 52% in that time frame, so the absolute numbers of people affected by these changes are substantial. It also is notable that the percent increase of obesity-associated cancer cases was higher among non-Hispanic Black and Hispanic women and men."

Researchers point out that many of the people 50 to 64 years of age with cancers diagnosed in the years from 2000 to 2016 are now cancer survivors, and many will be part of incoming Medicare cohorts or are now covered by Medicaid. It also is likely that these individuals will be covered by Medicaid, given the financial burden of cancer care. Thus, obesity-associated cancers have both a public health and public finance impact.

"We all know that public health education efforts are important to address the impact of obesity on individuals' health and quality of life," said Berger. "This analysis of the SEER data proves the point at a population level."

Brain circuit connects feeding and mood in response to stress

Many people have experienced stressful situations that trigger a particular mood and also change certain feelings toward food. An international team led by researchers at Baylor College of Medicine looked into the possi-

bility of a circuit between eating and mood and discovered a brain circuit in mouse models that connects the feeding and the mood centers of the brain. Published in the journal *Molecular Psychiatry*, these findings may

help explain some of the observations between changes in mood and metabolism and provide insights into future solutions to these problems by targeting this circuit.

"This study was initiated by first author Dr. Na Qu, a psychiatrist of Weitan Mental Health Center, China, when she was visiting my lab," said corresponding author Dr. Yang Xu, associate professor of pediatrics and of molecular and cellular biology at Baylor

College of Medicine. Qu, a practicing psychiatrist who also conducts basic brain research, was interested in investigating whether there was a neurological basis for the association between depression and other psychiatric disorders and alterations in metabolism, such as obesity or lack of appetite, she had observed in a number of

her patients. Qu, Xu and their colleagues worked with a mouse model of depression induced by chronic stress and observed that depressed animals on low and high weight. Then, they applied a number of experimental techniques to identify the neuronal circuits that changed activity when the animals were depressed.

Surgical masks as good as respirators or flu and respiratory virus protection

Researchers may finally have an answer to the long-running controversy over whether the common surgical mask is as effective as more expensive respirator-type masks in protecting health care workers from flu and other respiratory strains. A study published September 3, 2019 in JAMA compared the ubiquitous surgical (or medical) mask, which costs about a dime, to a less commonly used respirator called an N95, which costs around \$1. The study reported "no significant difference in the effectiveness" of medical

masks vs. N95 respirators for prevention of influenza or other viral respiratory illness.

"This study showed there is no difference in incidence of viral respiratory transmission among health care workers wearing the two types of protection," said Dr. Trish Perl, Chief of UT Southwestern's Division of Infectious Diseases and Geographic Medicine and the report's senior author. "This finding is important from a public policy standpoint because it informs about what should be recommended and what kind of protective apparel should be kept available for outbreaks."

Medical personnel — in particular nurses, doctors, and others with direct patient contact — are at risk when treating patients with contagious diseases such as influenza (flu). A large study conducted in a New York hospital system after the 2009 outbreak of H1N1, or swine flu, found almost 30 percent of health care workers in emergency departments contract-

ed the disease themselves, Dr. Perl said.

During that pandemic, the U.S. Centers for Disease Control and Prevention (CDC) recommended using the tighter-fitting N95 respirators, designed to fit closely over the nose and mouth and filter at least 95 percent of airborne particles, rather than the looser-fitting surgical masks routinely worn by health care workers, Dr. Perl said. But some facilities had trouble replacing N95s as supplies were used.

In addition, there are concerns health care workers might be less vigilant about wearing the N95 respirators since many perceive them to be less comfortable than medical masks, such as making it harder to breathe and being warmer on the wearer's face.

Earlier clinical studies comparing the masks and respirators yielded mixed results, said Dr. Perl, also a Professor of Internal Medicine who holds the Jay P. Sanford Professorship in Infectious Diseases.

New mechanism that could counteract obesity New mechanism that could

Obesity rates worldwide have nearly tripled since 1975. Now, new research from the University of Minnesota Medical School has discovered, in rodents, critical mutations in molecules implicated in obesity, which may help inform the development of new anti-obesity therapies.

Lead author Alessandro Bartolomucci, PhD, Associate Professor in the Department of Integrative Biology and Physiology at the U of M Medical School, and his team, which includes first author Bhavani Sahu, PhD, and Yuk Sham, PhD, U of M Medical School, discovered that critical

mutations in a peptide and a receptor, which are known to be implicated in obesity, diabetes, and hypertension in rodents, are critical for these biological activities. The findings, published in *Cell Reports*, suggest a new possible therapeutic approach to human obesity disease. Previous studies identified that a neuropeptide (named TLQP-21) in mice activates a receptor (named Chsh1) to increase the breakdown of fat for the body to produce energy. Bartolomucci and his team started to work in the context of humans and found that the human peptide is not very ac-

tive in inducing that biological activity, yet the biological pathway is conserved in obesity in humans and mice. They went on to test the rodent peptide with the human receptor and were able to see a biological effect, but found that it wasn't as strong as the rodent peptide with the rodent receptor.

After modeling the peptide/receptor interaction and analyzing the evolutionary history of how different species have evolved over time, they found that the combination of amino acids in the peptide and receptor is unique among the species analyzed and explains the enhanced

pharmacological activity in rodent and human cells. This combination is commonly found in a subgroup of rodents, called Murinae, which includes mice, rats and other small rodents commonly used in biomedical research.

"It is tempting to speculate that this cluster of mutations were selected during evolution to favor energy production in small-sized mammals like some rodent species," said Bartolomucci.

To prove this point, the team mimicked what took evolution millions of years to achieve and created a hybrid "mortalized" receptor.

'Smart' approach to detecting common heart condition

A new study, presented as 'Late Breaking Science' at the European Society of Cardiology (ESC) annual congress and published in the *Journal of the American College of Cardiology*, highlights the feasible use of mobile health (mHealth) devices to help with the screening and detection of a common heart condition.

Atrial fibrillation (AF) is a heart rhythm condition that causes an irregular and sometimes, abnormally fast heart rate. In AF, the heart's upper chambers (atria) contract randomly and sometimes so fast that the heart muscle cannot relax properly between contractions. This reduces the heart's efficiency and performance – but also leads to a higher risk of blood clots.

AF is the most common heart rhythm disturbance, affecting around one million people in the UK. People with AF are at increased risk of having a stroke and dying, as well as heart failure and dementia.

Currently, late detection due to lack of visible symptoms and

nonadherence are major problems in current management approaches for patients with suspected AF.

Health devices, such as fitness trackers, smart watches and mobile phones, may enable earlier AF detection, and improved AF management through the use of photoplethysmography (PPG) technology.

PPG is a simple and low cost optical technique that can be used to detect blood volume changes in the microvascular bed of tissue. It is often used non-invasively to make measurements at the skin surface.

Researchers, led by Associate Professor Guo from Chinese PLA General Hospital in Beijing, and Professor Gregory Lip, Lead for the Liverpool Centre for Cardiovascular Science/Prince of Wales Chair of Cardiovascular Medicine at University of Liverpool, aimed to determine the feasibility of AF screening in a large population-based cohort using smart devices with PPG technology, combined with a clinical care AF management pathway.

New peanut allergy treatment shows effectiveness and safety

People allergic to peanuts may have a new way to protect themselves from severe allergic reactions to accidental peanut exposure. It's called sublingual immunotherapy — or SLIT — and it involves putting a minuscule amount of ingested peanut protein under the tongue, where it is absorbed immediately into the bloodstream to desensitize the immune system to large amounts of peanut protein.

Published in the *Journal of Allergy and Clinical Immunology*, the research led by first author Edwin Kim, MD, assistant professor of medicine at the UNC School of Medicine, shows that SLIT could offer patients a safe and effective way to protect themselves from severe allergic reactions or even anaphylaxis.

"As a parent of two children with nut allergies, I know the fear parents face and the need for better treatments,"

said Kim, member of the UNC Children's Research Institute. "We now have the first long-term data showing that sublingual immunotherapy is safe and tolerable,

while offering a strong amount of protection." There are three main immunotherapy ways clinicians scientists have developed to treat nut allergies, and all of them attempt to desensitize the immune system to nut proteins to help patients avoid severe allergic reactions. According to Kim, about 100 mg of peanut protein can trigger a severe allergic reaction. That's the sort of trace amount in food "manufactured in a facility that processes peanuts." For reference, one peanut kernel contains about 300 mg.

"The main idea beyond immunotherapy is not for kids to be able to eat peanut butter and jelly sandwiches," Kim said. "It's to keep them safe from the small hidden exposures that could occur with packaged foods at restaurants, and with other food exposures." One immunotherapy method involves a patch on the skin that releases a small amount of peanut protein through the skin to desensitize the immune system. This approach has proved safe in clinical research but perhaps not as effective as researchers had hoped. It could become an FDA-approved treatment.

A second approach is called oral immunotherapy (OIT), which is currently under FDA review and a decision is expected this year. OIT requires patients to ingest a small portion of peanut protein daily, and over the course of time this can desensitize the immune system to accidental exposures. In a large phase 3 OIT clinical trial, patients initially ingested 0.3 mg of peanut and increased the amount to 300 mg

over the course of many weeks and then maintained that 300 mg daily intake for the remainder of the year. This trial showed substantial effectiveness in protecting patients but some patients suffered serious side effects. A subsequent meta-analysis of OIT clinical trial data published in *The Lancet* in April suggested that more clinical research on OIT was needed due to the risk of serious side effects.

A third approach is SLIT. Instead of having patients ingest peanut protein, doctors place a small amount of peanut protein under patients' tongues, where it is immediately absorbed. Because the peanut protein avoids digestion, patients are given much less peanut protein — about 0.002 mg initially. This amount then increases over the course of months to just 2 mg. In 2011, Kim and colleagues — including Wesley Burke, MD, dean

of the UNC School of Medicine — conducted a small study of 18 patients to show that SLIT was safe and effective over the course of one year. Since then, Kim and colleagues followed 46 patients in the SLIT protocol of 2 mg daily for five years. In the *Lancet* paper, the researchers showed that 67 percent of these patients were able to tolerate at least 750 mg of peanut protein without serious side effects. About 25 percent could tolerate 3000 mg.

Kim's data shows SLIT was about as effective as OIT, though the SLIT study was much smaller. And SLIT posed much less risk of serious side effects. The most common side effect was itchiness around the mouth that lasted about 15 minutes and did not need treatment. No one left the study early because of side effects.

"SLIT participants showed interest between 10 and 20 times more peanut protein than it

would take for someone to get sick," Kim said. "We think this provides a good cushion of protection — maybe not quite as good as OIT — but with an easier mechanism (sublingually) and, as far as we can tell right now, a better safety signal."

Kim's lab has finished a separate SLIT study of 4 mg daily for 55 patients over the course of four years. He hopes to publish results here this year. "With sublingual immunotherapy, we hope we can maintain our safety profile while seeing an even stronger benefit for patients," Kim said.

Kim and colleagues are also studying SLIT in a subset of children ages 1 to 4 because separate OIT data indicated these youngest patients have a stronger, more lasting benefit to immunotherapy.

"We focus on the idea there is no one perfect drug for food allergy," Kim said.

Long-term benefits of a low-fat diet

A team led by researchers at Fred Hutchinson Cancer Research Center has identified several women's health benefits from a low-fat diet. The findings, published in the September issue of the *Journal of Nutrition*, found a low-fat diet commensurate with an increase in fruit, vegetable and grain servings reduced death following breast cancer, slowed diabetes progression and prevented coronary heart disease.

Dr. Ross Prentice, member of the Cancer Prevention and Biostatistics programs at Fred Hutch and his colleagues in the Women's Health Initiative originally launched the Dietary Modification Trial in 1995. The study

involved nearly 49,000 postmenopausal women across the U.S. to test whether a low-fat dietary pattern would reduce the risk of breast and colorectal cancers and coronary heart disease. After nearly nine years of dietary change, they found that the low-fat diet did not significantly impact outcomes for these conditions. However, after longer-term follow-up of nearly 20 years, researchers found significant benefits, derived from modest dietary changes

emerged and persisted including:
 A 15-25% reduction in deaths from all causes following breast cancer
 A 13-23% reduction in insulin-dependent diabetes
 A 15-30% reduction in coronary heart disease

among 23,000 women without baseline hypertension or prior cardiovascular disease

"The WHI's Dietary Modification Trial has provided women with nutrition and disease prevention insights for some years," Prentice said. "The latest results support the role of nutrition in overall health, and indicate that low-fat diets rich in fruits, vegetables and grains have health benefits without any observed adverse effects."

Unlike other studies examining the link between diet, cancer and other diseases, WHI investigators designed the study as a long-term, randomized controlled clinical trial to limit bias and establish causal conclusions.

Benefits of cognitive behavioral therapy for IBS continue 2 years after treatment

Irritable Bowel Syndrome (IBS) is a common gastrointestinal disorder affecting 10-20 per cent of people. Abdominal pain, bloating and altered bowel habit significantly affect patient's quality of life and can force them to take days off work.

Previous research (the ACTIB trial) led by Professor Hazel Everitt

at King's College London, showed that Cognitive Behavioral Therapy (CBT) tailored specifically for IBS and delivered over the telephone or through an interactive website is more effective in relieving the symptoms of IBS than current standard care one year after treatment.

This 24-month follow-up research published in *Lancet Gastroenterology and Hepatology* has shown that benefits continue two years after treatment despite patients having no further therapy after the initial CBT course. These results are important as previously there was uncertainty whether the initial benefits could be sustained in the long

term.
